

SQL Workshop – Business Scenario

Scenario

You are working as a **Data Analyst** in a growing E-commerce company in Egypt.

The company sells a variety of products such as electronics, accessories, and furniture.

Customers from different cities place orders using multiple payment methods like Cash, Visa, and Instapay.

Each order may include discounts, and orders can have different statuses such as *Delivered*, *Cancelled*, or *Pending*.

The management team wants to better understand customer behavior, sales performance, and business trends in order to make data-driven decisions.

Your task is to analyze the data and answer the following business questions using SQL.

Business Questions

1. Retrieve all orders that occurred in 2023.
2. Retrieve all orders with status = 'Delivered'.
3. Retrieve all customers who live in Cairo.
4. Retrieve all products with price greater than 5000.
5. Retrieve all orders where the discount is greater than 10%.
6. Count the total number of orders.
7. Calculate the total quantity of products sold.
8. Calculate the average product price.
9. Count the number of orders for each order status (Delivered, Cancelled, Pending).
10. Count the number of customers in each city.
11. Retrieve each order along with the customer name who made it.
12. Retrieve each product along with the total quantity sold.

13. Calculate total sales for each product
(price × quantity × (1 - discount/100)).
14. Find the top 5 customers based on total spending.
15. Retrieve customers who made more than 3 orders.
16. Find the total sales for each city.
17. Find the most sold product (by quantity).
18. Calculate the total revenue generated for each payment method.
19. Find the monthly total sales trend.
20. Identify high-value customers who:
 - made more than 3 orders
 - and spent more than 20000

The goal is not just to write SQL queries, but to translate business questions into actionable insights.
